

Repair of Fibreglass Doorskins

IDM Doors Ltd Data Sheet 3

Fibreglass is an extremely tough material but should minor damage occur it can be repaired.

Scratches

Minor scratches can be covered over with special touch up paints available from IDM Doors Limited.

In some instances coloured scratch-filling polish as used on car bodywork may also be used. Deeper scratches will require filling with a coloured wax or a matched paint.

Damaged Skin

If a small area of the skin has been damaged then it may be repaired with polyester based filler material. Some skill is required to achieve good results when re creating the woodgrain effect.

If the damaged area is large difficult to match into the existing colours then the whole door may need to be repainted

The materials for repairs are available from most car accessory shops or automotive paint suppliers.
